Lead Trace

Discover leads.

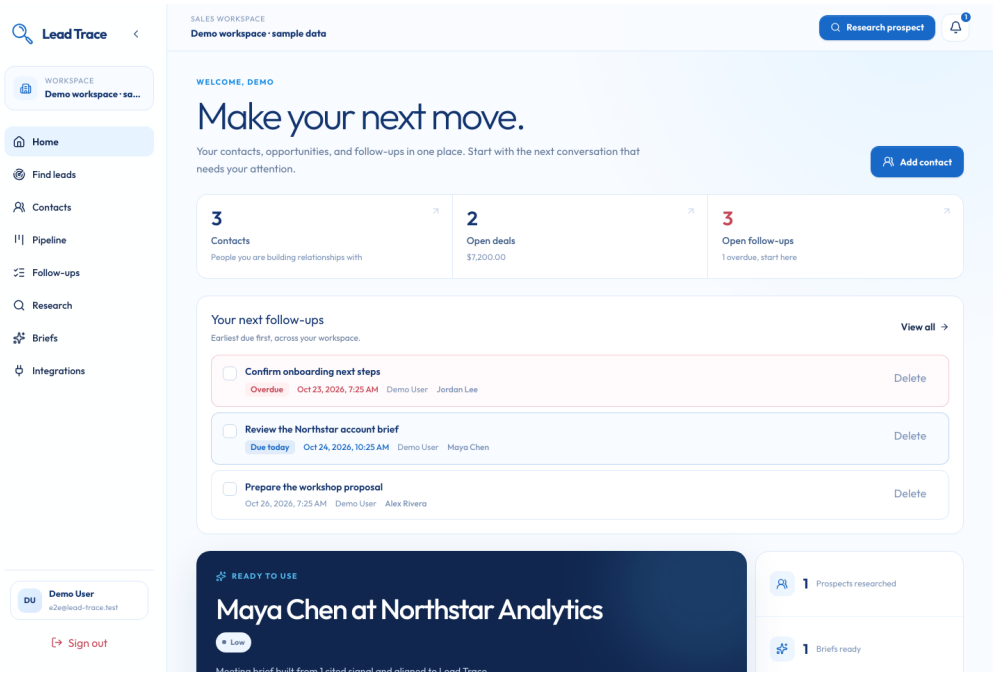

Manage the relationship.

Public-source lead discovery, a built-in CRM, and cited sales research in one workspace.

InsightIQ is now Lead Trace

InsightIQ → **Lead Trace**

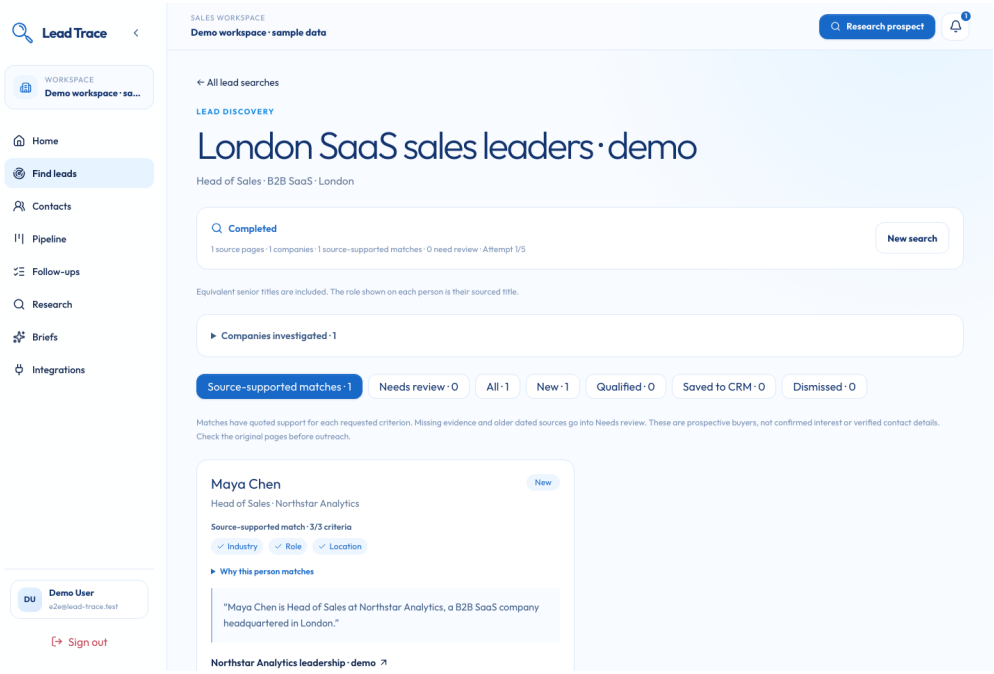

We listened to feedback from industry professionals and expanded the project around the work of sales teams. Lead discovery, CRM, and research now connect in the current application.

Current application UI with fictional sample data.

The working sales flow

Review the evidence, save the contact, and keep the next action visible.

Fictional demonstration search. A source-supported match is not confirmed buying interest.

01 Discover relevant prospects

Specify the buyer role, market, and location. Deep mode investigates up to eight companies using bounded search, full-page reads, and site crawls.

02 Review the source support

Inspect quoted evidence for role, industry, and geography. Missing or stale evidence remains in Needs review. Public registries help corroborate company facts.

03 Save to the built-in CRM

Qualify before saving. Keep the source history with the contact, then track ownership, deals, notes, and follow-ups.

04 Prepare with cited research

Add the offer and choose meeting preparation or outreach. Inspect the claim, hypothesis, question, and research gaps before reusing a brief.

05 Set the next action

Move the opportunity through the pipeline, complete or reopen a follow-up, or schedule through an authorized Google Calendar account.

Current scope and next priorities

Available in the current code

- Deep lead discovery and source review
- Contacts, ownership, and record controls
- Deal pipeline in Board and Table views
- Notes and dated follow-ups
- CSV import and export
- Cited briefs, outreach messages, and sharing
- Optional Google Calendar event creation

Next priorities

- Shared company records
- Contact merging
- Recurring lead searches
- Email integration
- Two-way Calendar sync

These remain development priorities; scope and release plans can change with feedback.

How it runs

Next.js runs on Cloudflare through OpenNext. The NestJS API manages accounts, CRM, and leased lead-discovery jobs. PostgreSQL stores workspace data and job state. A separate Python/LangGraph worker builds research briefs.

Tavily Search, Extract, and Crawl supply public web evidence. GLEIF, Wikidata, and SEC EDGAR provide bounded company checks. Qwen through DashScope supports lead qualification and research. Calendar uses member authorization for event creation.

What the recorded live audit demonstrated

On 23 October 2026, one US SaaS sales-leader cohort returned 9 prospects, with 1 supported by all requested criteria. The reviewed prospect was saved to CRM and researched to completion, with 11 sources and 15 evidence items. This small audit is not a precision, recall, or market-coverage benchmark.

Source: docs/lead-generation-live-audit.html. Public evidence can be stale; buying interest, budget, and contact deliverability remain unverified. Calendar needs OAuth consent; this material does not claim a live Google event was created.
