Lead Trace

From industry feedback to a broader sales workflow

We listened to feedback from industry professionals and used it to shape the next stage of our project. InsightIQ is now Lead Trace.

Lead Trace

The foundation

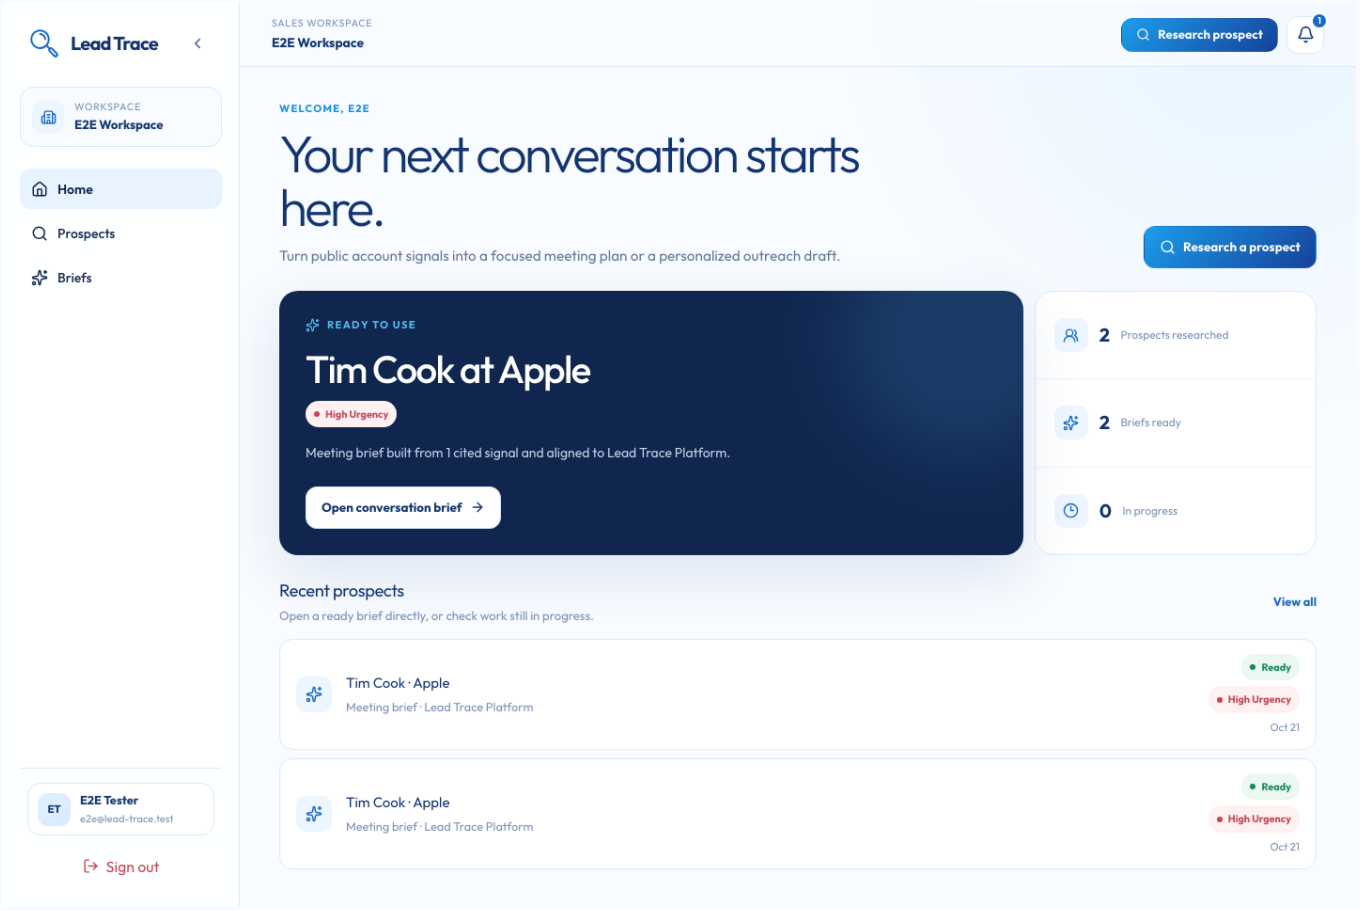

The project began with prospect research and cited Deal Briefs. That research and briefing workflow remains available in the current application.

The direction ahead

We are expanding toward lead generation, CRM, and related sales workflows. We will refine the feature set, pitch, documentation, and release plans as development and feedback progress.

Research you can inspect

Give the application a prospect, describe what you sell, and choose meeting preparation or outreach.

Demonstration fixture data, not a live research run or measured sales outcome.

01 Save context — Keep the prospect, offer, and goal together.

02 Find sources — Discover public information and store source links.

03 Build a cited brief — Connect selected claims to hypotheses and questions.

04 Review and reuse — Inspect gaps, adapt outreach, then copy, export, or refresh.

The next stage

Available today

Prospect and offer context, public-source research, cited briefs, outreach drafts, shared briefs, and workspace accounts.

Planned direction

Lead generation, CRM, and connected sales workflows. These capabilities are planned, with scope and release plans still to be finalized.

How the current foundation runs

Next.js on Cloudflare provides the web app. A NestJS API, Python/LangGraph worker, and PostgreSQL run on a VPS. Tavily discovers sources. Qwen through DashScope supports evidence extraction and briefing.
